Project Report

- **Learning Management System:**

For my project, I am developing a Learning Management System- Blackboard. There have been a lot of issues with all other LMS UI as we discussed earlier. And that made me interested in this project idea. I have designed the UI for the student interface.

There are three files: Home.html, script.js and style.css.

The interface shows the menu option which consists of student ID photo, name and other options like notifications, setting etc.

There is a student dashboard which highlights 4 main options: course, notifications, messages and grades. There is a calendar along with the task list with the deadlines.

There is a feature named my course standing which will show students their academic standing in that particular course. It will help them focus on their future assignments and exam. The main thing is professors will allocate their grading criteria and based on that it will guide students to score better grades in that course.

I will be focusing on the back end of the project from now. I will start creating other interfaces and I will start developing the professor's interface along with this.
