Internet and Web Systems

Week - 1

- I have searched several topics and ideas for this project and what can be implemented in the best ways. I found few topics that dragged my attention: Project Management System and Blackboard-new.

- There are so many Project Management sites available in the market. They have really good features and they are user friendly too. But there are very few free sites available. Some of the sites allow just up to 5 team members in Project Management Systems if you are using a free version.

- Blackboard made me more interested than any other ideas. I took Human Computer Interactions course and we discussed so many issues in the current websites or projects. UML Blackboard is a better platform for students to learn and discuss with the course peers. But there are some flaws in the site that students face. One of the major flaws is the UI. For instance, it is a little bit unsorted. It is a cluster of many options. Most of the students find it confusing. Even though it allows pretty good options and features it is difficult to find them and use them. I believe front end is also as important as back end of any project. The other thing is not all the professors and students use this site.

- I find an opportunity in this because there are ample improvisations which can be integrated so that all professors and students can access this platform for their benefits. This can be better developed and used.
